

Exercises

Chapter 4.2 - The Lambda Calculus

Exercise 1

Keeping in mind alpha equivalence, choose an answer that is equivalent to the listed lambda term.

1. $\lambda xy.xz$
 - (a) $\lambda xz.xz$
 - (b) $\lambda mn.mz$
 - (c) $\lambda z(\lambda x.xz)$
2. $\lambda xy.xxy$
 - (a) $\lambda mn.mnp$
 - (b) $\lambda x.(\lambda y.xy)$
 - (c) $\lambda a(\lambda b.aab)$
3. $\lambda xyz.zx$
 - (a) $\lambda x.(\lambda y.(\lambda z))$
 - (b) $\lambda tos.st$
 - (c) $\lambda mnp.mn$

Solutions to exercise 1

1. $\lambda xy.xz$
 - (b) $\lambda mn.mz$
2. $\lambda xy.xxy$
 - (c) $\lambda a(\lambda b.aab)$
3. $\lambda xyz.zx$
 - (b) $\lambda tos.st$

Exercise 2

Which (two or more) of the following are equivalent?

1.

$$\text{mth } x \ y \ z = x * y * z$$

2.

$$\text{mth } x \ y = \lambda z \rightarrow x * y * z$$

3.

$$\text{mth } x = \lambda y \rightarrow \lambda z \rightarrow x * y * z$$

4.

$$\text{mth} = \lambda x \rightarrow \lambda y \rightarrow \lambda z \rightarrow x * y * z$$

Solutions to exercise 2

All are equivalent to each other

Exercise 3

The type of **mth** (above) is

$$\text{mth} :: \text{Num } a \Rightarrow a \rightarrow a \rightarrow a \rightarrow a$$

Write down the type of

$$\text{mth } 3$$

Solutions to exercise 3

$$\text{mth } 3 :: \text{Num } a \Rightarrow a \rightarrow a \rightarrow a$$

Exercise 4

Rewrite, using Haskell and evaluate the following:

1. $(\lambda x.x)2$
2. $(\lambda x.(x * 2))4$
3. $(\lambda x.(\lambda y.x * y))3 \ 4$
4. $(\lambda x.\lambda y.(if \ x < y \ then \ -1 \ else \ if \ x == y \ then \ 0 \ else \ 1)) \ 3 \ 4$
(**Note:** Use of if inside the lambda expression.)

Solutions to exercise 4

1. 2
2. 8
3. 12
4. -1

Exercise 5

Rewrite the f function in the *where* clause using anonymous lambda syntax

```
addOneIfOdd n = case odd n of
  True  -> f n
  False -> n
  where f n = n + 1
```

Solutions to exercise 5

```
addOneIfOdd n = case odd n of
  True  -> (\x->x+1) n
  False -> n
```

Exercise 6

Rewrite the following to use anonymous lambda syntax

```
addFive x y = (if x > y then x else y) + 5
```

Solutions to exercise 6

```
( \x y-> if x > y then x+5 else y+5) 3 4 --applying it to 3 4
```

Exercise 7

Write a lambda version of the following functions:

1. **abs**: which takes an Integer and returns the non-negative value.
e.g. $\text{abs } -1 = 1$, $\text{abs } 4 = 4$.
2. **mymax**: which takes two numbers and returns the larger of the two
3. **mymin**: which takes two numbers and returns the smaller of the two

Solutions to exercise 7

1. *abs*:

```
(\x -> if x < 0 then (-x) else x) (-4) --applying it to (-4)
```

2. *mymax*:

```
(\x y -> if x > y then x else y) 14 5 --applying it to the  
arguments 14, 5
```

3. *mymin*:

```
(\x y -> if x < y then x else y) 14 5 --applying it to the  
arguments 14, 5
```

Exercise 8

Using the techniques seen in class, encode the following using lambda calculus:

1. AND
2. OR

Solutions to exercise 8

1. AND
 $\lambda a. \lambda b. a \ b \ FALSE$
2. OR
 $\lambda a. \lambda b. a \ TRUE \ b$
